

Socio-Economic Benefits of Austin's Tree Canopy

Final report presented by:

Kyle Fuchshuber (Project Manager)

Jerad Laxson (Asst. Project Manager)

Megan Thomas (Editor & Researcher)

Eric Tijerina (Graphic Designer & Researcher)

Zachary Dye (GIS Specialist & Researcher)

Introduction

- Urban Tree Canopy and Socio-Economic Benefits:

- Carbon sequestration
- Reduce Storm Water Runoff
- Energy Reduction
- Higher Quality of Life
- Less \$\$

(United State Environmental Protection Agency)

- Benefits of our study

- COA legislative decisions
- Green future that is economically feasible for Austin, TX

Primary Areas of Study

- Crime rates
 - Lower crime = less costs and happy citizens
- Property values
 - Higher property value = higher property taxes and affluent citizens

Property Values Research

- Twin Cities
 - Increasing tree cover w/in 250 meters = 60% gain in home sale prices

- Comparison Model
 - How do external factors relate?

(Sander 2010)

Crime Rates research

- Baltimore
 - Strong negative relationship
 - Portland
 - Moderately negative in old growth forests
- (Donovan, Prestemon, 2010)

Methodology – Tree Canopy and Property Values

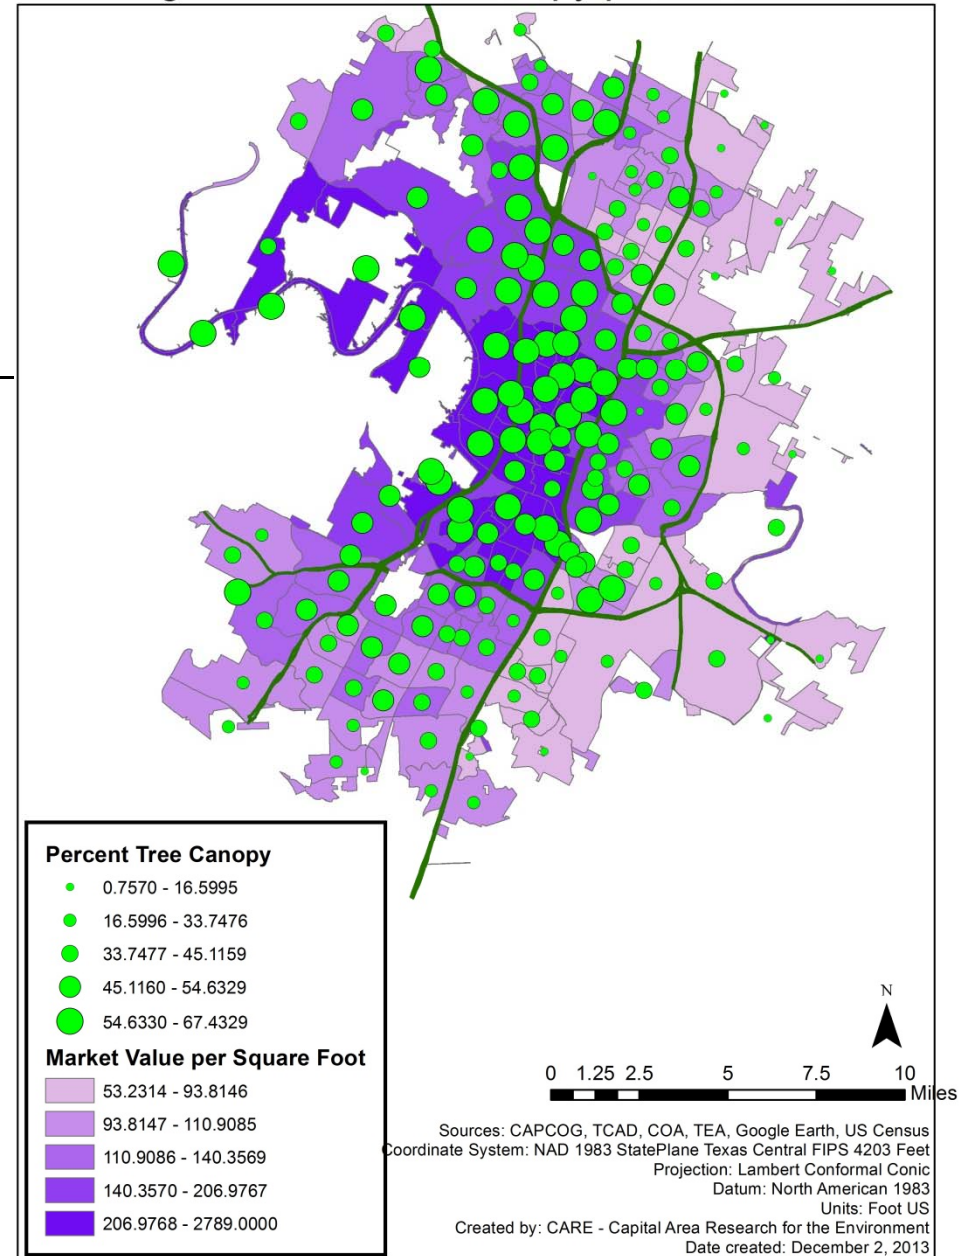

- Single-family residences extracted from parcel data
- Averages of tree canopy percentages and property market prices per square foot joined to relative census tract area

Apparent patterns...

- Census tracts are assigned average market price of single-family parcels within tract area
- Percent tree canopy is assigned to census tracts in same manner

Average Property Prices per Square Foot and
Average Percent Tree Canopy per Census Tracts

Methodology – Tree Canopy and Property Values

- Geographically Weighted Regression

- Explanatory variables:

- Percentage of tree cover
- Texas Education Agency ranked schools
- Proximity to parks/natural attractions
- Proximity to Cultural Attractions
(Theatres, Shopping, Nightlife)

Geographically Weighted Regression

β_1 Tree canopy + β_2 Schools + β_3 Parks + β_4 Cultural Attractions

= Property Value

Ranking of Parks/Natural Areas

- - Ranking census tracts
 - a. Rank parks by size
 - b. Assign Value by Parks Number Range
 - c. Rank Census Tract by Value of Parks in Individual Tract
- Parks Ranking
 - Hot Spot Isolation
 - a. CoA Data Used
 - b. Buffer
 - c. Clip with Study Area
 - d. Intersect Findings for

Final

Parks Austin, TX

Coordinate System: NAD 1983 StatePlane Texas Central FIPS 4203 Feet
Projection: Lambert Conformal Conic
Datum: North American 1983
Created By: C.A.R.E

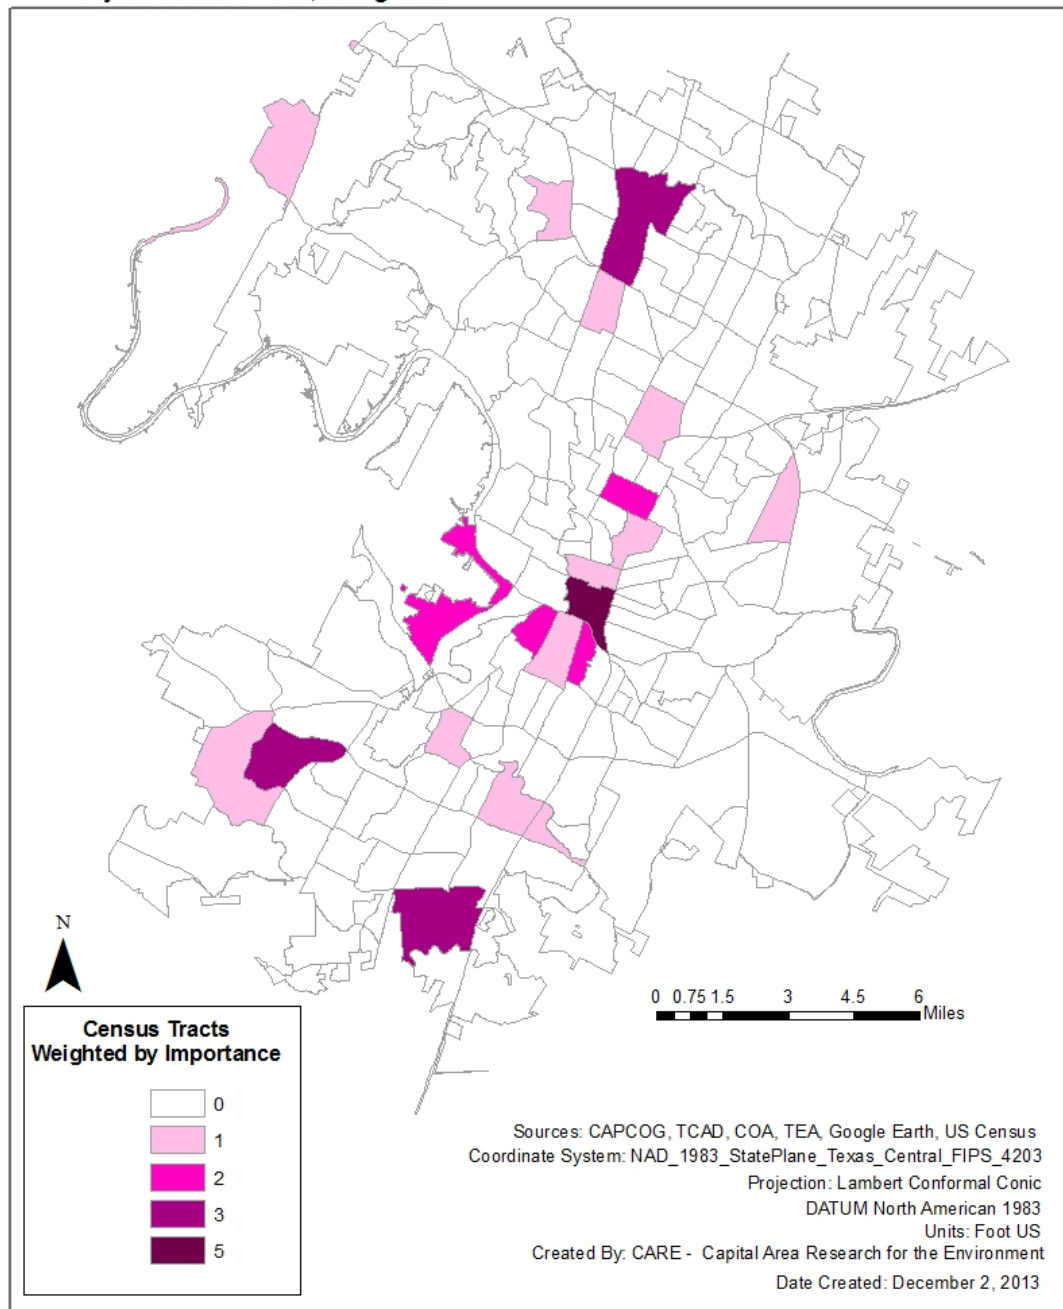

Ranking Cultural Attractions:

Most Important Areas:

- Shopping Centers/Malls
 - Cinemas/Theaters
 - Nightlife
- Each venue/area was then weighted:
 - No venues = 0
 - Theater, performing arts center, or cinema = 1
 - Nightlife area = 1
 - Regular shopping center = 1
 - Major shopping center or mall = 2.
 - If more than one venue exists in a census tract, the values are added up, for a total of up to 5. Values ranged from 0 to 5.

Cultural Attractions

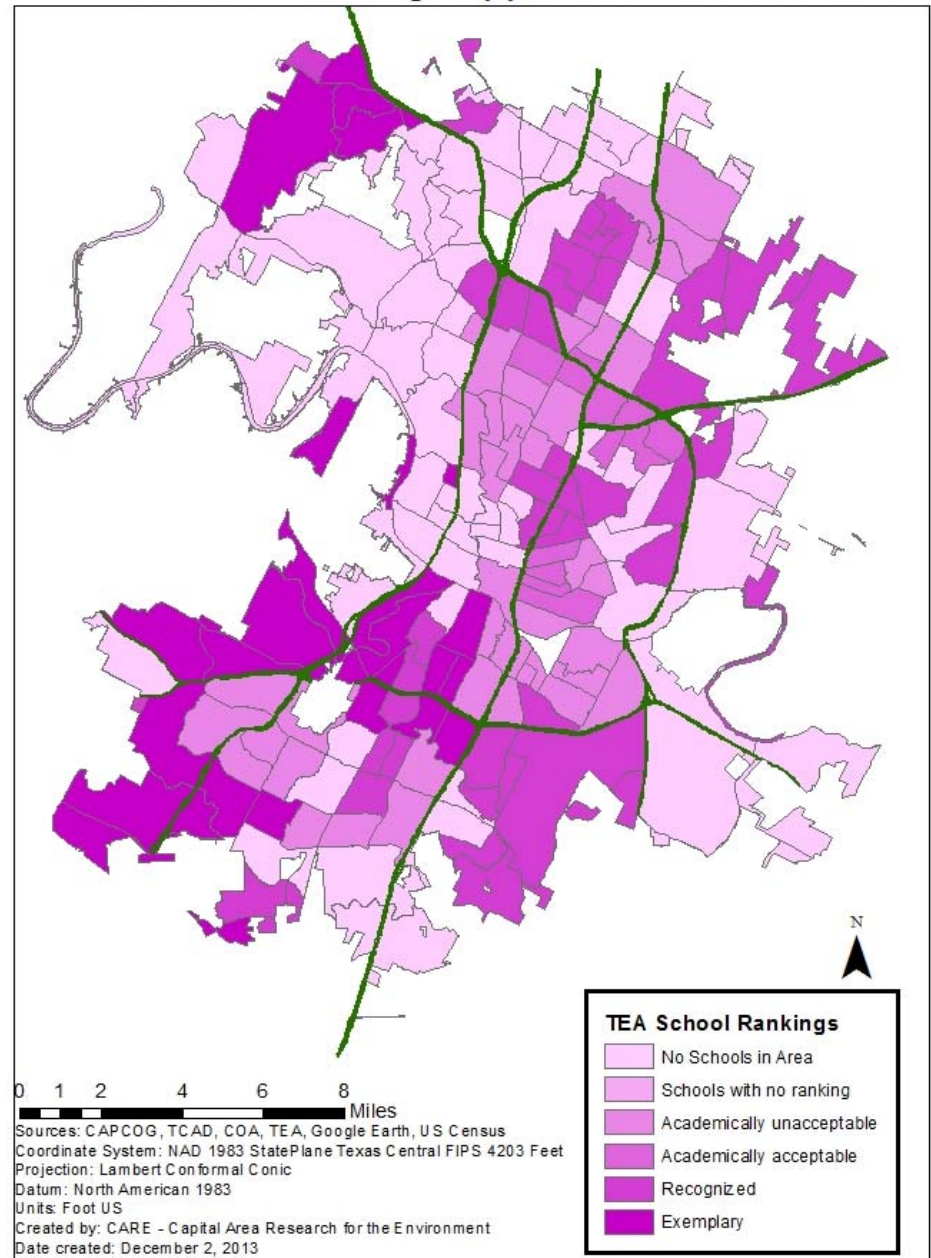

By Census Tracts, Weighted

Ranking Schools

- Schools located by points
- Each school given Texas Education Agency ranking:
 - No ranking/data: 1
 - Academically unacceptable: 2
 - Academically acceptable: 3
 - Recognized: 4
 - Exemplary: 5
- Schools then joined to census tracts
 - Rank averages calculated
- Census tracts ranked by:
 - Number of schools
 - Average ranking
 - Most reoccurring school ranking within tract

TEA School Rankings Applied to Census Tracts

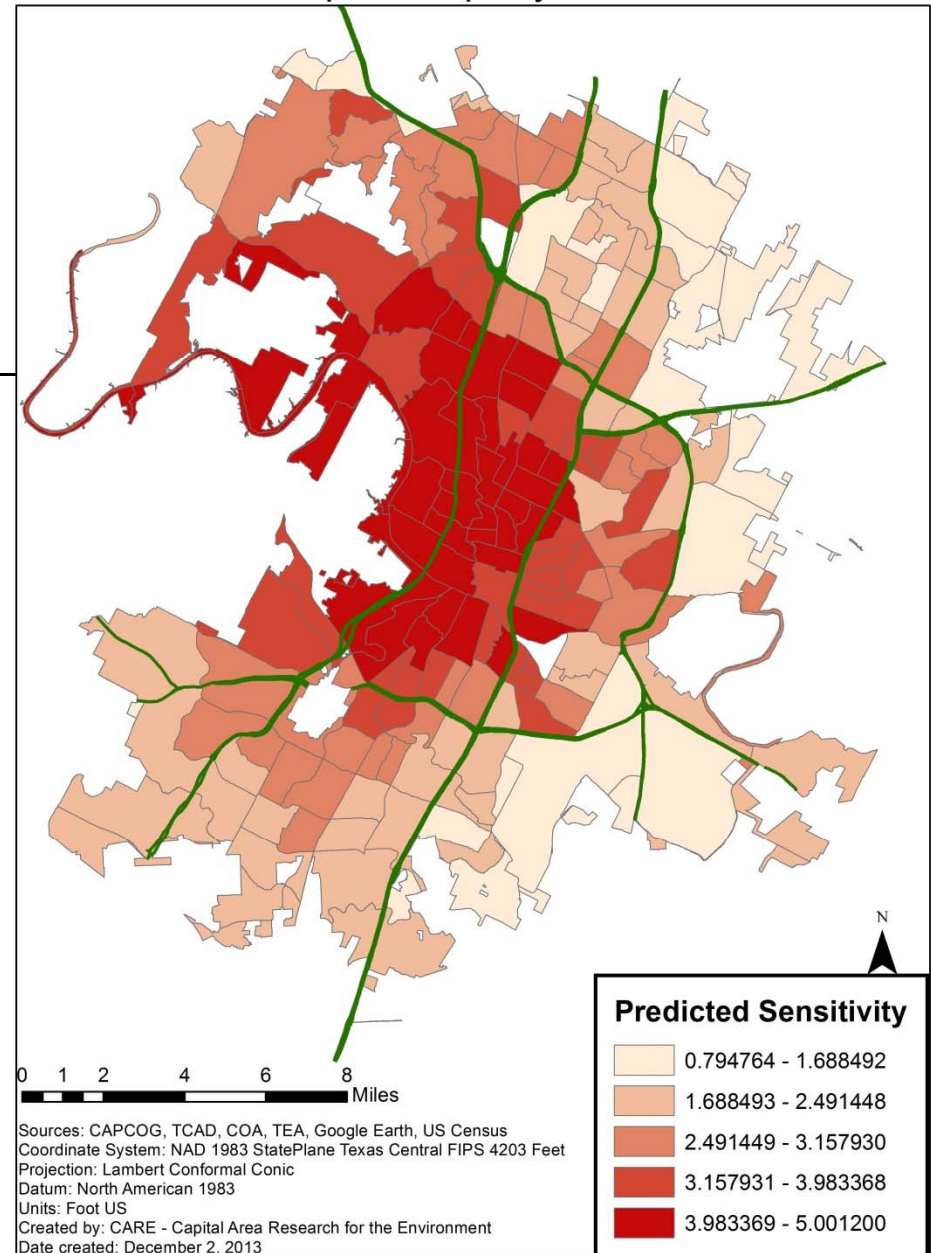

Tree Canopy's Effects upon Property Values:

Results

Prediction follows High Value = High Tree Coverage pattern

- Tree Cover and Property Value are directly correlated with no explanatory variables
- Prediction follows hypothesis: higher percentage of tree cover is associated with higher property values

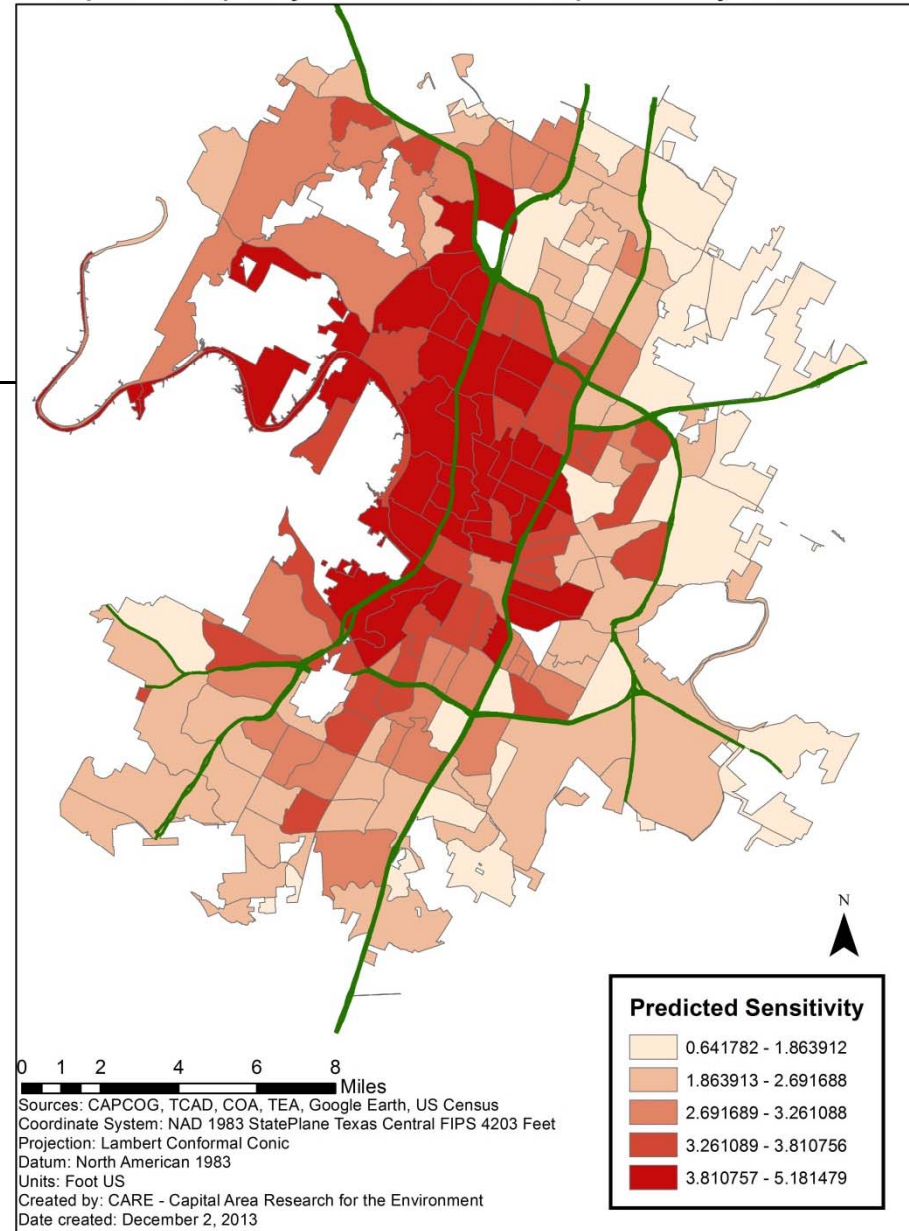

Predicted Sensitivity of Tree Cover's Effect Upon Property Values

Prediction with considerations

- Property value is correlated to tree cover as well as other explanatory variables
- Areas closer to central business districts and proximity to parks also have an influence on property values

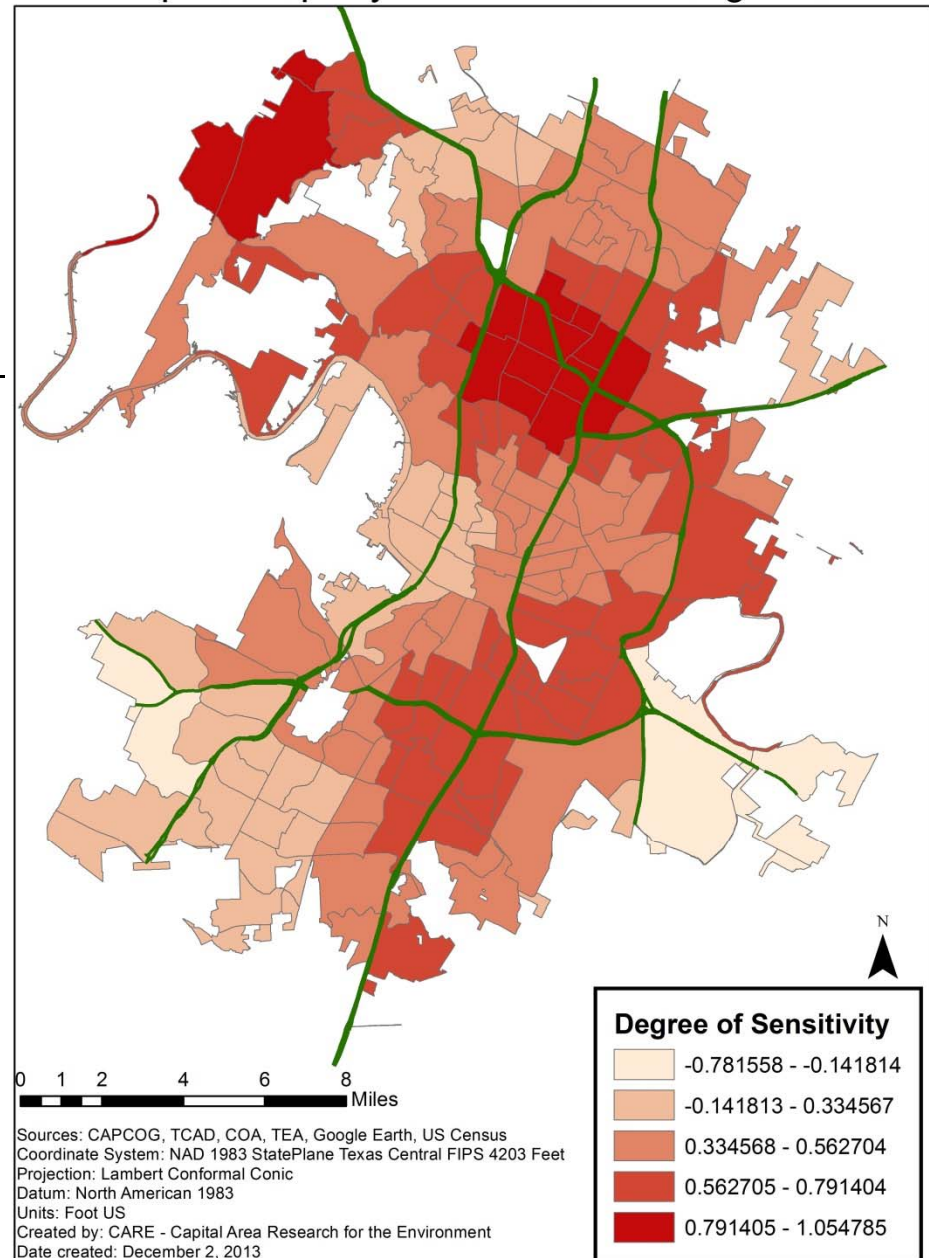

Predicted Sensitivity of Tree Cover's Effect Upon Property Values with Explanatory Variables

Direct Correlation

- Tree Cover and Property Value are directly correlated with no explanatory variables
- Darker hues of red indicate that the area's property values are more sensitive to tree cover

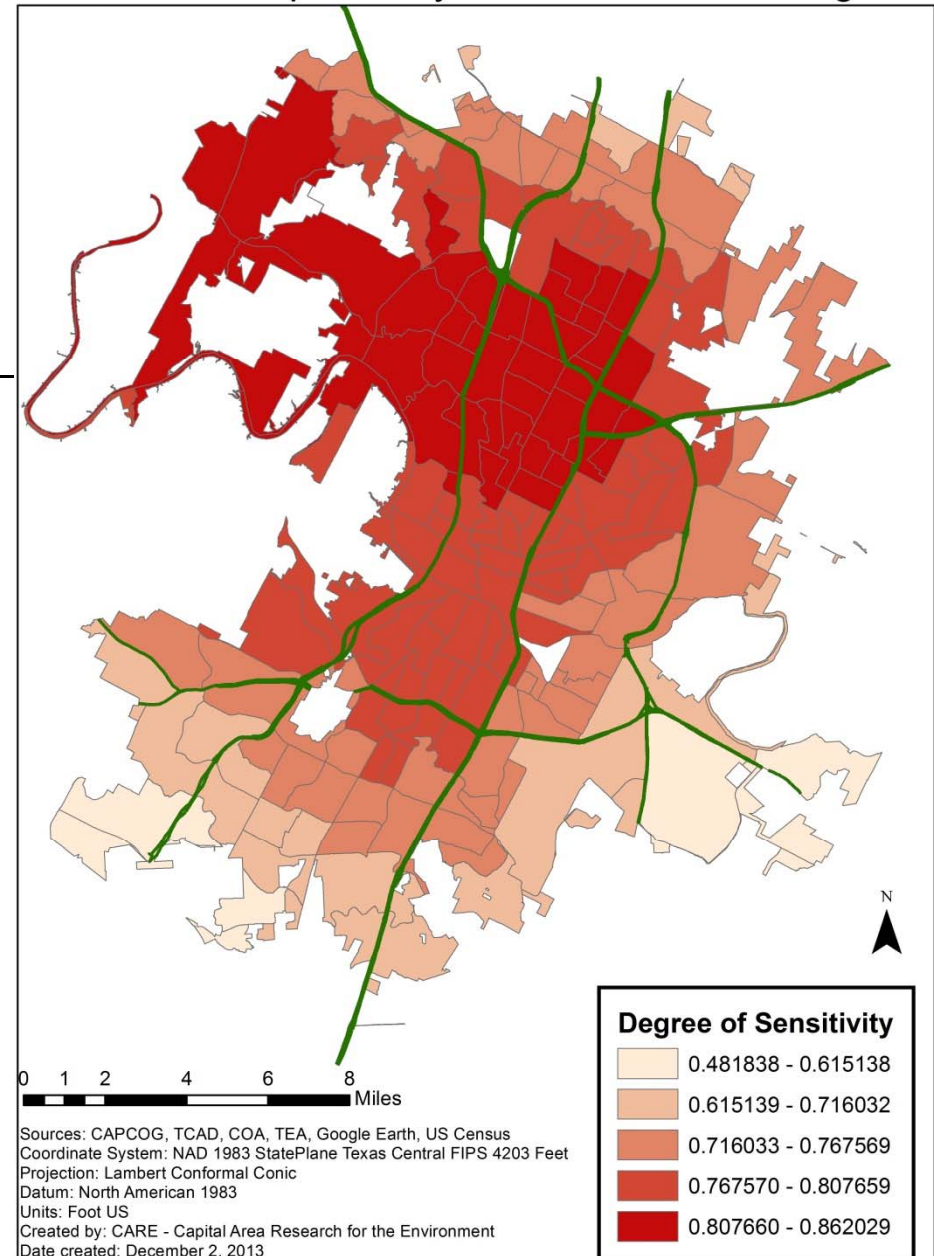

Sensitivity of Tree Cover's Effect
Upon Property Values - Fixed Neighbors

Explanatory Variables give closer look of reality

- Property value's sensitivity to tree cover is correlated with tree cover as well as other explanatory variables
- Area of highest positive correlation represents 23% of Austin's single family homes.

Sensitivity of Tree Cover's Effect Upon Property Values with Explanatory Variables - Fixed Neighbors

Conclusions

- 23% of all single-family parcels will benefit greatly from tree coverage.
- Tree canopy has a positive correlation to property values in the City of Austin

Data

- TCAD Parcels – Percent Tree Canopy and Property Market Prices
- US Census Tracts
- TEA – School Rankings
- CAPCOG – City of Austin Border
- Google Earth – Cultural Attractions
- City of Austin - Parks

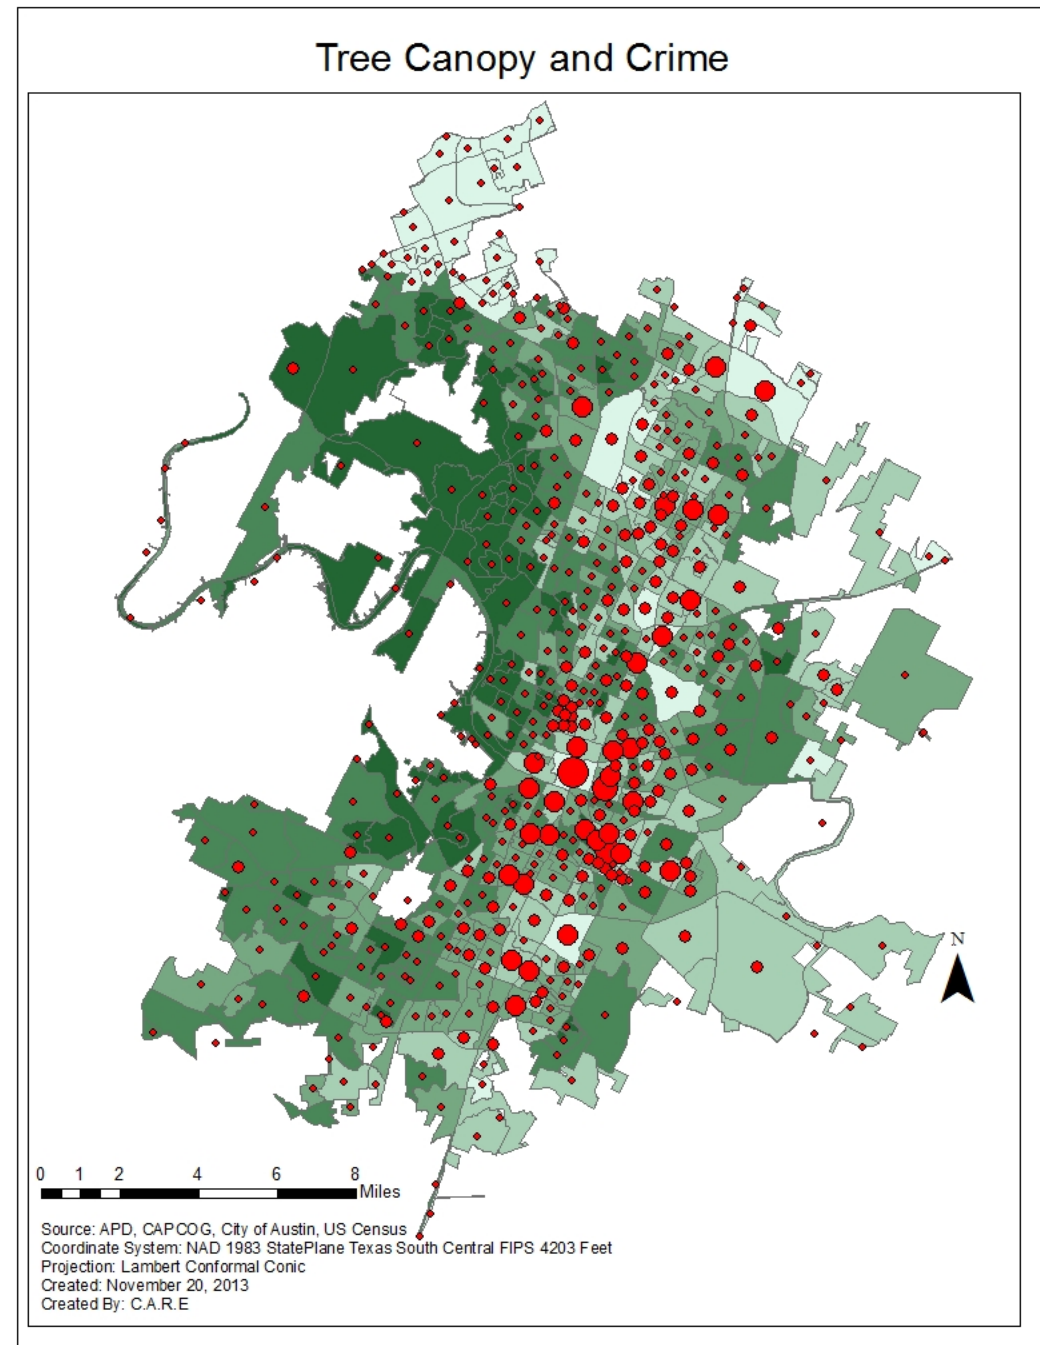

Tree Canopy's Effects upon Crime Rates:

Results

Results

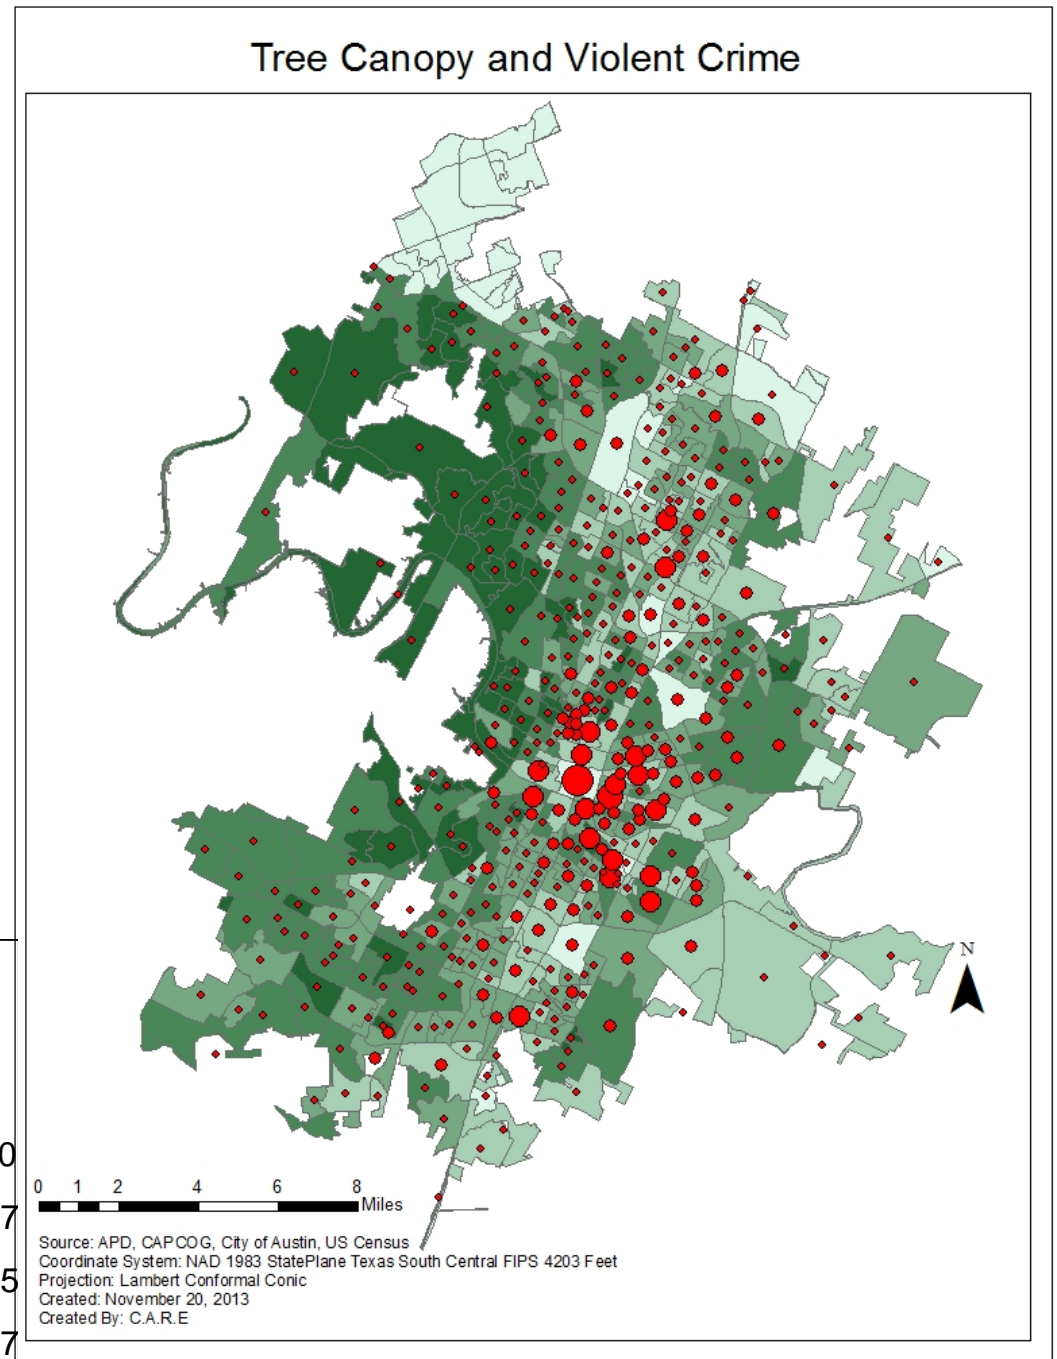

- Figure 1A:

Results

- Figure 1B:

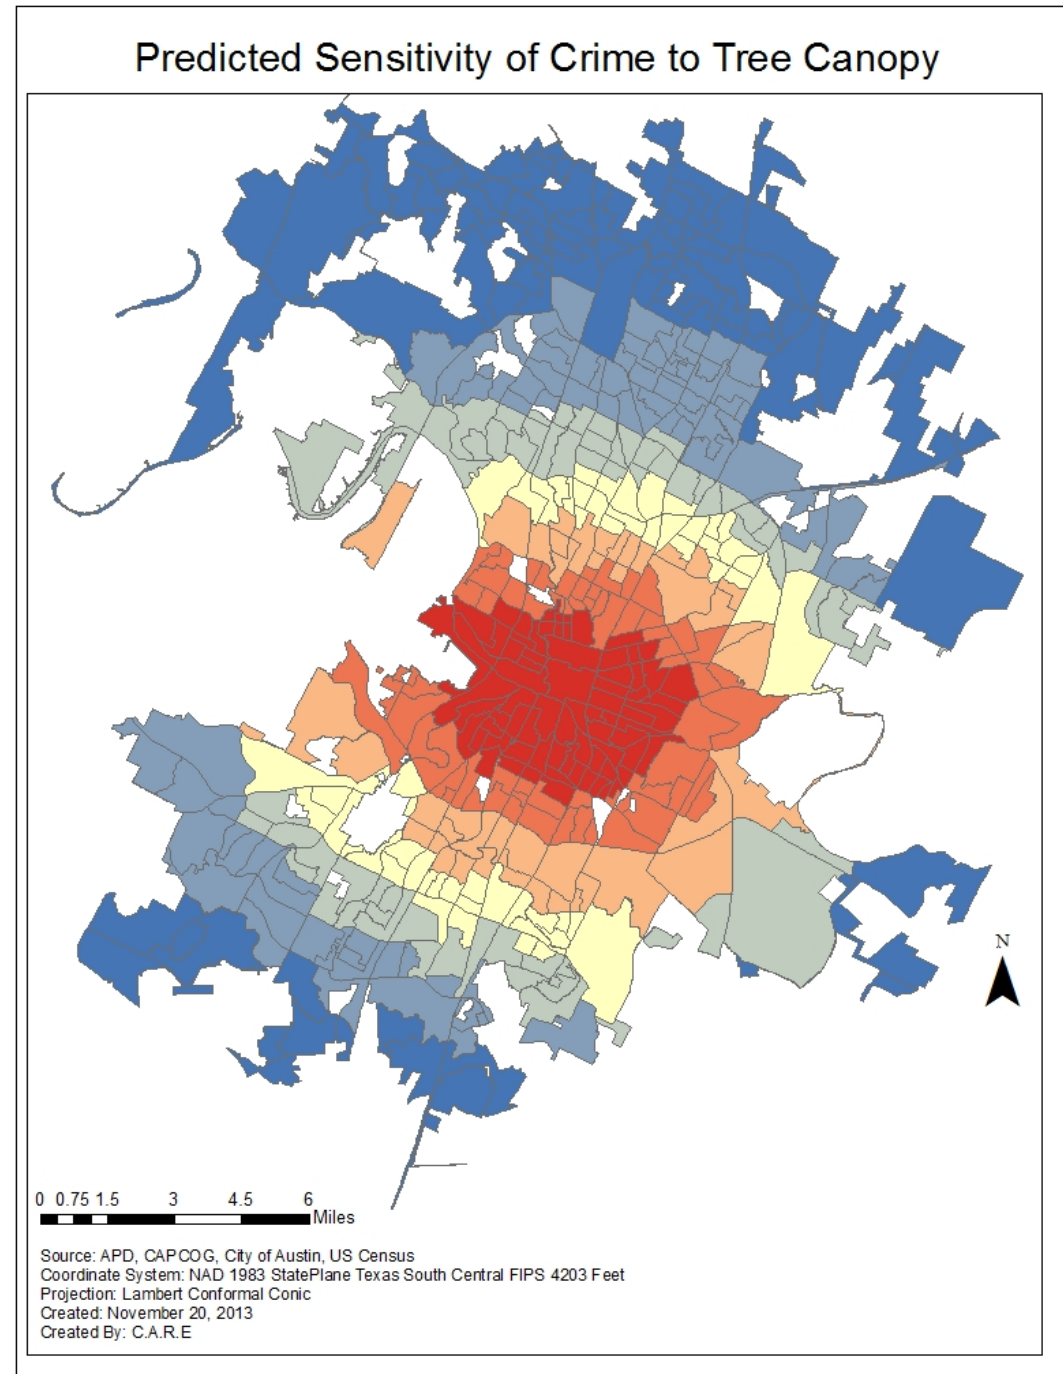

| Violent Crimes Tree Canopy | |
|----------------------------|---------------|
| Yearly Total | Percent |
| • 0 - 12 | 0- 11.73 |
| • 13 - 35 | 11.73 - 27.90 |
| • 36 - 67 | 27.90 - 42.87 |
| • 68 - 317 | 42.87 - 57.95 |
| • 318 - 1149 | 57.95 - 83.97 |

Sensitivity to Tree Canopy Violent Crime

Predicted Sensitivity of Violent Crime to Tree Canopy, Population total, and Median Income

Results

- Figure 5B

Discussion

- Correlation is not particularly significant.
- More variables need to be considered.
- Model could have been more confident in its prediction.

Conclusion

- Increase in tree canopy decreases crime.
- Greater relationship near downtown.

Data

- TCAD Parcels – Percent Tree Canopy and Property Market Prices
- US Census Tracts
- TEA – School Rankings
- CAPCOG – City of Austin Border
- Google Earth – Cultural Attractions
