

Non-Radioactive Hazardous Materials Route Designation Study

We want to hear your feedback! This map shows some of the factors considered during the study, as well as examples of options considered for north-south NRHM through-routing. Please feel free to leave a comment with your thoughts on other considerations or where you think the route should go. Note that the study also looked at locations of public schools, crash probability, congestion, potential burden to commerce, route continuity, and location of emergency response agencies.
