

AUSTIN TRANSPORTATION DEPARTMENT

MEMORANDUM

TO: Robert Spillar, P.E., Director,
Austin Transportation Department

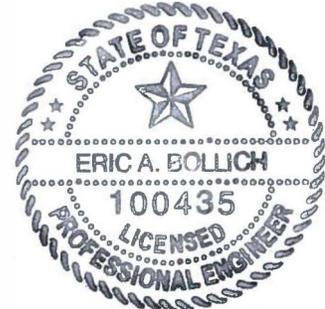

FROM: Eric Bollich, P.E., PTOE, Managing Engineer,
Austin Transportation Department

CC: Anna Martin, P.E., Assistant Director,
Austin Transportation Department

Lewis Leff, Transportation Safety Officer,
Austin Transportation Department

DATE: May 11, 2022

SUBJECT: Speed Modification Report – City of Austin Level 3 and 4 Streets Outside of the Urban Core

E. Bollich

5/11/22

The Austin Transportation Department (ATD) completed this engineering study to recommend speed modifications for Level 3 and 4 streets as classified in the *Austin Strategic Mobility Plan (ASMP)* outside of the Urban Core of the City of Austin (City), defined as outside of the area bounded by US 183, SH 71/US 290, and Loop 1 (MoPac).

This study summarizes the background, methodology, and recommendations to set speed limits based on the context and operating characteristics of streets meeting the criteria set herein.

Summary of Recommendations

Based on this engineering evaluation, the Office of the City Traffic Engineer has determined the following speed limit modifications should be entered into the City's Code of Ordinances based on ATD's evaluation of safe and prudent speeds. ATD, under the authority of the Office of the City Traffic Engineer, intends to bring an item for Council action to set new speed limits on the identified streets based on the following recommendations:

- **Recommendation 1:** Modify speed limits on 48 Level 3 and 4 street segments, resulting in lowered speed limits between 5 miles per hour (mph) and 15 mph. Street segments impacted by Recommendation 1 are detailed in Table 1.

Additionally, some Level 3 and 4 streets do not have speed limits included in the City's Code of Ordinances but have posted speed limits. These streets should be added to the Code of Ordinances for enforceability as they are not covered by prima facie speed limits of 30 mph.

- **Recommendation 2:** Formally set speed limits in the City’s Code of Ordinances on four Level 3 and 4 street segments. Street segments impacted by Recommendation 2 are detailed in Table 2.

Per Texas Transportation Code, Section 545.356, speed limit modifications set by municipalities are effective when signs are posted messaging new speed limits.

- **Recommendation 3:** ATD will develop a plan to install signage needed for streets impacted by speed limit modifications recommended in this engineering study. The signage installation plan will include the design and placement of signage; prioritization of implementation based on documented safety concerns and geographic dispersion; and time and material cost estimations to complete sign installation. Given the quantity of signage requiring change, ATD will request Council authorize the speed changes, pending appropriate signage placement under the administrative authority of the Office of the City Traffic Engineer.

ATD’s review of best practices revealed that comprehensive speed limit modifications are most effective when coupled with public awareness efforts. The intent of the effort is to reach a broad audience with a focused, consistent message to bring attention to the purpose and desired outcomes of speed limit modifications.

- **Recommendation 4:** ATD will conduct a citywide public awareness effort to increase awareness of the pending speed limit modifications. ATD will ensure that educational awareness materials are culturally relevant and that they explain the need for the change and their intended safety goal. ATD will partner with law enforcement agencies as possible to achieve the intended speed outcome through targeted education and enforcement activities, particularly on streets with documented speeding concerns.

Background

Level 3 and 4 streets are broadly defined as arterial (major) streets designed to carry high volumes of traffic, normally at higher speeds than streets in residential settings. They provide access to a variety of land uses and generally accommodate longer intracity trips. Austin has experienced decades of double-digit population growth and metropolitan area expansion, changing the operating characteristics of the City’s roadway network during this time. Most of the speed limits on Level 3 and 4 streets that were established before this rapid growth and have not been evaluated for appropriateness under current developed conditions.

ATD completed a separate engineering report in 2020 with recommendations to lower speed limits on 15 Level 3 and 4 streets within the Urban Core. City Council approved these recommendations in June 2020, leading to lowered speed limits entered into the City’s Code of Ordinances and posted on the corresponding streets by the end of that year. This study follows up that report addressing the previously unstudied arterials outside of the Urban Core.

Methodology

Texas Transportation Code, Section 545.356, and City of Austin Code, Chapter 12, give authority to municipalities to alter speed limits based an engineering and traffic investigation by a professional engineer. This speed modification report fulfills this engineering study requirement under authority of the Office of the City Traffic Engineer.

The traditional transportation engineering methodology of investigating and recommending speed limits relies on the 85th percentile of vehicular speeds. This is based on the premise that drivers under unimpeded, free-flowing traffic conditions choose to travel at safe and prudent speeds for themselves and others. This methodology has limitations in urban settings where other considerations, such as turning conflicts, driveway density, and traffic signals, impede the natural flow of traffic and require more attention for drivers to operate safely.

ATD researched emerging national practice for setting speed limits that are more applicable to this network and decided to use an expert systems methodology for this engineering study. Expert systems are credited with starting in Australia and were based on numerous data collection studies and observations by engineering experts. These findings were used to develop computer programs replicating the thought processes and judgments of these experts based on a variety of street operating characteristics. Completed in 2006, *NCHRP 03-67: Expert System for Recommending Speed Limits in Speed Zones* was one of the first studies in the United States “to develop a new knowledge-based expert system for recommending enforceable, credible speed limits in speed zones,” resulting in the original USLIMITS methodology.

The Federal Highway Administration (FHWA) subsequently released USLIMITS2 as a web-based tool to develop credible and consistent speed limits. Rather than relying foremost on the 85th percentile of vehicular speeds, USLIMITS2 uses these additional inputs in its methodology:

- 50th percentile speed
- Section length of streets
- Annual average daily traffic
- Adverse alignment
- One- or two-way operation
- Divided or undivided streets
- Number of through lanes
- Area type (adjacent development)
- Number of driveways/uncontrolled access points
- Number of traffic signals
- On-street parking and usage
- Pedestrian and bicycle activity
- Crash data

After working with FHWA representatives for firsthand instruction on this tool, ATD used USLIMITS2, combined with engineering judgment, to develop speed limit modifications in this engineering study. Appendix A includes a detailed summary of USLIMITS2 input values and output recommendations used for each engineering study. Appendix B includes maps of existing speed limits, speed limits recommended by ATD, and changes between the two values. National research and guidance materials on setting appropriate speed limits are included in Appendix C.

Findings and Recommendations

ATD analyzed 121 Level 3 and 4 streets located outside of the Urban Core using street characteristic inputs and USLIMITS2 methodology. The Office of the City Traffic Engineer applied engineering judgment to further reduce the speed limits on some streets resulting from the USLIMITS2 methodology based on continuity of speed limits on a street or consistency of speed limits with comparable streets. This engineering judgment was applied to harmonize speeds along arterials and to also maintain driver expectation for the purposes of safety.

Some roadways within the City of Austin have posted speed limits but are not formally documented in the City’s Code of Ordinances. These roadway segments with undocumented speed limits were also studied and are included in Table 1 if the recommended speed is lower or equal to the posted speed.

Overall, speed limit reductions on 48 of these street segments were found to be appropriate, resulting in recommended reductions of 5 mph on 38 street segments, reductions of 10 mph on nine street segments, and a reduction of 15 mph on one street segment. One street segment with an existing posted speed limit but not in the Code of Ordinances is recommended to remain at the posted speed limit.

Recommendation 1: Speed limits should be modified in or added to the City’s Code of Ordinances per Table 1.

Table 1: Recommended Speed Limit Modifications

Council District	Street	Extents		Exist. Speed Limit	Prop. Speed Limit
		From	To		
1	Canyon Ridge Drive (West)	IH-35 (North) East Frontage Road	Tech Ridge Boulevard	40	35

10	Far West Boulevard	Chimney Corners	Loop 1 (MoPac Expressway) (North) West Frontage Road	35	30
10	Great Hills Trail	Stonelake Boulevard	Loop 360 (Capital of Texas Highway) (North)	35	30
10	Jollyville Road	Balcones Woods Drive	Great Hills Trail	45	40
10	Jollyville Road	N Capital of Texas Highway	Business Park Drive	35	30

* Existing speed limit is not documented in the City’s Code of Ordinances. Listed existing speed limit is posted speed.

Four roadways in Table 2 within the City of Austin full purpose jurisdiction have no posted speed limits and are not included in the City’s Code of Ordinances. The Office of the City Traffic Engineer applied engineering judgment to recommend speed limits on these streets to be added to the Code of Ordinances.

Recommendation 2: Speed limits should be formally set in the City’s Code of Ordinances per Table 2.

Table 2: Recommended Streets for Code of Ordinances Speed Limit Establishment

Council District	Street	Extents		Posted Speed	Prop. Speed Limit
		From	To		
8	Ben Garza Lane	Brodie Lane	Loop 1 (MoPac Expressway) (South)	None	35
7	Center Lake Drive	Howard Lane (East)	Parmer Lane (East)	None	40
7	Lakeline Mall Drive	U.S. 183 (North) (Research Boulevard)	Terminus east of Lyndhurst Street	None	35
6	Stonehollow Drive	Metric Boulevard	Metric Boulevard	None	35

Signage Plan

Per Texas Transportation Code, Section 545.356, speed limit modifications set by municipalities are effective when signs are posted messaging new speed limits. For operational purposes, ATD recommends Council approve the new speed limits pending placement of the signs as per our normal process, giving the Office of the City Traffic Engineer the administrative authority to place the signs as quickly as is feasible.

Recommendation 3: ATD will develop a signage installation plan to evaluate signage needed for streets impacted by Recommendations 1 and 2 of this engineering study. This plan will include the following:

- **Design** and place signage to set speed limits on streets. This includes methods to increase **sign conspicuity**, which could include increased sign size, non-typical colors, and supplemental **safety** messages. A standard sign spacing will be developed, which could include a **maximum distance** between speed limit signs and consistent placement before and after intersections with major streets.
- **Prioritize** sign placement for streets with school zones and if within the City's designated **High-Injury Network**. Signs will be prioritized first if a school zone is located within the modified speed zone. Signs will be prioritized second if the modified speed zone is located within the City's designated High-Injury Network. Subsequent sign installation will be prioritized based on documented safety concerns and geographic dispersion.
- **Estimate** the time needed to install all needed sign changes citywide based on staff availability and material costs to make set speed limits effective.

Education and Enforcement

ATD's review of best practices revealed that comprehensive speed limit modifications are most effective when coupled with public awareness efforts as they help reach a broad audience with a focused, consistent message to bring attention to the purpose and desired outcomes of speed limit modifications.

Recommendation 4: ATD will conduct a citywide public awareness effort to increase awareness of the pending speed limit modifications. ATD will ensure that educational awareness materials are culturally relevant and that they explain the need for the change and their intended safety goal. ATD will partner with law enforcement agencies to achieve the intended speed outcome through targeted education and enforcement activities, particularly on streets with documented speeding concerns.

Conclusion

The speed limit modifications recommended in this engineering study are the result of a comprehensive, years-long traffic investigation of Level 3 and 4 streets outside the Urban Core in the City of Austin. It is a progressive and bold approach based on national best practice to modernize the speed limits on Level 3 and 4 streets which represent the highest propensity of serious injuries and fatalities in the City. These recommendations will help increase the safety of all users of the street network by setting speed limits to safe and prudent levels.

National Research and Guidance on Setting
Appropriate Speed Limits

National Research and Guidance on Setting Appropriate Speed Limits

Numerous national studies and reports mention the critical role that speed plays in severe traffic crashes. The National Transportation Safety Board, the Governors Highway Safety Association, the Insurance Institute for Highway Safety, National Highway Traffic Safety Administration, and the Federal Highway Administration are just a few of the organizations whose work we have reviewed in order to better understand the need for a comprehensive speed management approach.

National Transportation Safety Board Safety Study

- found that speed was a documented factor in 31% of all traffic fatality crashes nationally. "Speed—and therefore speeding—increases crash risk in two ways: (1) it increases the likelihood of being involved in a crash, and (2) it increases the severity of injuries sustained by all road users in a crash." The study demonstrates how speeding presents different risks for different road users. People walking, biking, and riding scooters are all much more vulnerable to serious injury or fatality when a speeding car is involved. The risk for vulnerable users more than doubles from 20 MPH to 30 MPH and is increasingly worse at higher speeds. Speed influences the risk of crashes and crash injuries in three ways:

- The distance a vehicle travels from the time a driver detects an emergency to the time the driver reacts is increased.
- The distance needed to stop a vehicle once the driver starts to brake is increased.
- The exponential increase in crash energy. For

example, when impact speed increases from 40 to 60 mph (a 50% increase), the energy increases by 125% (IIHS, 2018b)."

NCHRP 03-67 – This digest presents the results of the study titled “Expert System for Recommending Speed Limits in Speed Zones,” describing “research conducted to develop a knowledge-based expert system decision-support tool for recommending speed limits in speed zones on highways and local roads that are considered credible and enforceable.” It contains three sections: Research Scope and Motivation; Expert System Decision Rules and their Derivation; and Software Application and its Use.

Research Results Digest 318

AN EXPERT SYSTEM FOR RECOMMENDING SPEED LIMITS IN SPEED ZONES

This digest presents the results of NCHRP Project 3-67, “Expert System for Recommending Speed Limits in Speed Zones.” The study was conducted by a team led by the University of North Carolina Highway Safety Research Center with Wade Trim Associates, Inc. and PB Farradyne, Inc. Raghavan Srinivasan, Senior Transportation Research Engineer at the Highway Safety Research Center, was the Principal Investigator.

SUMMARY

This digest describes research conducted to develop a knowledge-based expert system decision-support tool for recommending speed limits in speed zones on highways and local roads that are considered credible and enforceable. The tool is intended to assist responsible authorities in setting speed-zone limits to enhance traffic safety and operating efficiency. The system has been designed to be useful for all types of primary roadways, from rural two-lane segments to urban freeway segments. The system does not address statutory limits such as maximum limits set by legislatures for Interstates and other major classes of roadways, temporary or part-time speed limits such as those posted in work zones and school zones, or variable speed limits that change as a function of traffic, weather, and other conditions. The expert system is designed to be implemented as a web-based software application.

The digest is based primarily on the final report for NCHRP Project 3-67, “Expert System for Recommending Speed Limits in Speed Zones” (available from

the project description page of the TRB website: <http://www.trb.org/TRBNet/ProjectDisplay.asp?ProjectID=821>). The project reviewed current literature on guidelines, criteria, and procedures used for setting speed limits in speed zones in the United States and experience with use of XLIMITS, USLIMITS, and other existing speed-limit expert systems. A group of subject-matter experts engaged in setting and enforcing speed limits was convened to provide underlying decision rules for the expert system. The software application was developed with consideration of user needs and requirements for long-term management and maintenance of the expert system. (The application can be accessed through the Internet at <http://www2.uslimits.org> and is available for download and installation on an Internet server from the TRB website at http://www.trb.org/news/blurb_detail.asp?id=7568.)

This digest is organized into three sections and an appendix. The first section describes the motivation for the research and the scope of NCHRP Project 3-67. The second section describes the decision rules embedded in the expert system and how

TRANSPORTATION RESEARCH BOARD
OF THE NATIONAL ACADEMIES

USLIMITS2 – The FHWA developed this web-based tool to “help practitioners set reasonable, safe, and consistent speed limits for specific segments of roads.” Its methodology was based on NCHRP 03-67 and uses several factors of street operating characteristics as inputs to develop recommended speed limits. The [User Guide](#) and [Decision Rules](#) documentation provide further details and guidance on how to use the USLIMITS2 tool.

USLIMITS2

A Tool to Aid Practitioners in Determining Appropriate Speed Limit Recommendations

FHWA offers FREE technical assistance to State and local agencies that are interested in learning more about using USLIMITS2. This includes answering questions, providing in-person workshops, providing virtual workshops held via a web conference, and giving presentations about USLIMITS2. To request technical assistance, send an email to help@uslimits.org

USLIMITS2 is a web-based tool designed to help practitioners set reasonable, safe, and consistent speed limits for specific segments of roads. The tool is applicable to all types of roads; however, it is not applicable to school zones or construction zones. USLIMITS2 is of particular benefit to local communities and agencies without ready access to engineers experienced in conducting speed studies for setting appropriate speed limits. For experienced engineers, USLIMITS2 can provide an objective second opinion and increase confidence in speed limit setting decisions.

USLIMITS2 was developed based on research through National Cooperative Highway Research Program (NCHRP) Project 3-67 and considers all major factors used by practitioners to make engineering judgment in determining an appropriate speed limit. This includes: operating speeds (50th and 85th percentile), annual average daily traffic, roadway characteristics and geometric conditions, level of development in the area around the road, crash and injury rates, presence of on-street parking, and extent of ped/bike activity, as well as several others depending on the road type. These factors are further described in the User Guide, NCHRP 3-67 report, and Decision Rules documentation.

Disclaimer: The U.S. Government assumes no liability for the use of the information contained in this tool. This tool does not constitute a standard, specification, or regulation.

USING USLIMITS2

Before beginning a new project, it is recommended that you read through the User Guide and be prepared to enter the necessary data (e.g., 50th and 85th percentile speed, roadway characteristics, and crash history). If the segment you are studying is a new route, the system will not require this data, but it is recommended that the statutory speed be posted on new routes until such time that reliable data on operating speed, crashes, and other factors can be collected.

After entering all project information you will have the opportunity to save the recommendation report. You also can save the project file and upload it in the system at a later time to revise your project if needed.

To understand how USLIMITS2 arrived at the recommended speed limit, review the Decision Rules.

Technical Support

If you have any questions about USLIMITS2 or experience any technical difficulties while using this program, find any bugs, or have suggestions for improving USLIMITS2, please send an email to help@uslimits.org

ACHIEVING MULTIMODAL NETWORKS

APPLYING DESIGN FLEXIBILITY
& REDUCING CONFLICTS

U.S. Department of Transportation
Federal Highway Administration

AUGUST 2016

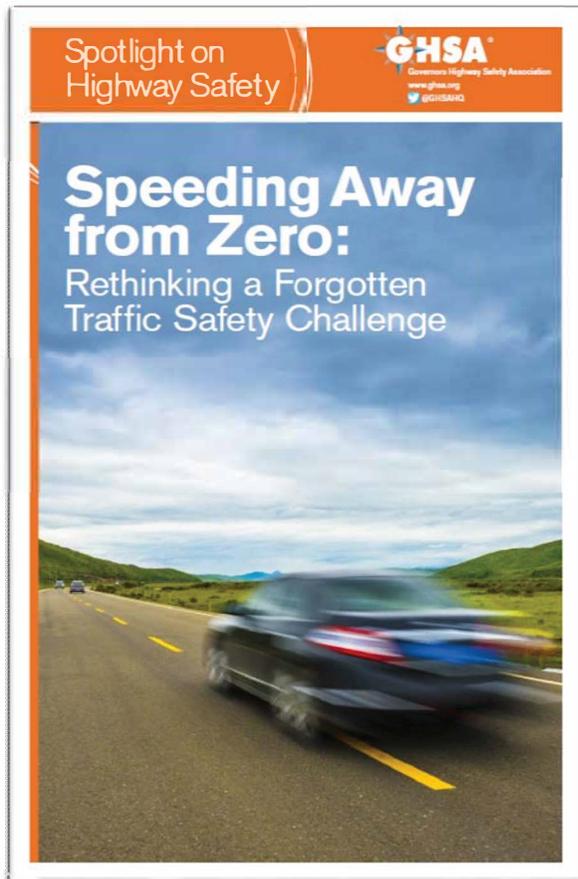

FHWA "Achieving Multimodal Networks" –

Safety as a Guiding Principal: "Where modes come together, the design should eliminate conflicts to the greatest extent possible. If it is not feasible to eliminate the conflict entirely, designers should minimize the speed differential between modes to ensure that if a crash occurs, the severity of the injury is likely to be lower...Designers have the flexibility to set design speeds lower than the posted speed limit."

Page 23:

As motor vehicle speeds increase, the risk of serious injury or fatality for a pedestrian also increases (AARP Impact Speed and a Pedestrian's Risk of Severe Injury or Death 2011, p. 1). Also, motorist visual field and peripheral vision is reduced at higher speeds.

Governors Highway Safety Association - "Speeding remains a publicly-accepted driving behavior that is reinforced among motorists, policymakers and transportation stakeholders. National surveys of U.S. drivers have found that although drivers identify speeding as risky, drivers nonetheless continue to speed. Drivers have a minimal perception of risk of either getting a ticket, causing a crash, or violating social norms."

"Research has shown raising speed limits to match the 85th percentile speed increases the average operating speed of the roadway, consequently increasing the 85th percentile speed."

"In 2013, the Washington legislature enacted a law allowing municipalities to establish a maximum speed limit of 20 mph in a residential or business district. This new law mandates that a reduced speed need not be based on any traffic or engineering studies, which were acknowledged as procedural roadblocks to making speed limit changes. The law also allows a municipality to reinstate a former speed limit if deemed necessary within a year of its change without a traffic or engineering study. New York City, which has a high-

profile Vision Zero initiative, reduced its citywide speed limit to 25 mph as authorized by a 2014 New York State law. As of January 9, 2017, Boston reduced its default speed limit from 30 mph to 25 mph. IIHS evaluated the effects of this speed limit reduction and found that the reduction was associated with a 0.3% reduction in mean speeds. However, when looking at the odds of vehicles exceeding 25 mph, 30 mph, and 35 mph, reductions were increased to 2.9%, 8.5%, and 29.3% respectively. This study concluded that lowering the speed limit in urban areas is an effective countermeasure to reduce speeds and improve road safety (Hu and Cicchino, 2018b)."

Report Recommendation: Improve State and Local Policy

"Support Speed Limits According to Vision Zero Principles: States and localities should set reasonable speed limits in accordance with Vision Zero principles in built-up areas where there is a mix of vulnerable road users and motor vehicle traffic, at intersections and locations with a high risk of side collisions, and on rural roads without a median barrier to reduce the risk of head-on collisions.

States should also provide local communities with discretion to set speed limits and deploy speed management countermeasures in order to meet local needs."

Texas Strategic Highway Safety Plan - Pedestrian Safety, Strategy 6A -

Encourage use of target speeds that consider pedestrians, land use, and the roadway context (e.g., a target speed of 35 mph or less on arterials). Other examples are to provide design flexibility guidance for techniques to reduce operating speeds on surface streets; encourage use of tree-lined medians, bicycle lanes, and safe and attractive pedestrian crossings and walkways; and support use of traffic calming for local streets.

All Users Safety, 6B - Design new roadways for a target speed appropriate for the adjacent environment and safety of all users rather than for a design speed intended to maximize motor vehicle speeds.

Speeding Strategy 1: Encourage use of target speeds for arterial, collector, and local roadways; encourage use of target speeds with pedestrian, land use, and roadway context, including options for

target speeds of 35 mph or less on arterials and the evaluation of existing speed limits to appropriate target speeds.

Urban
NACTO Street
Design
Guide

OVERVIEW

OCTOBER 2012

NACTO Urban Street Design Guide -

"There is a direct correlation between higher speeds, crash risk, and the severity of injuries... Design streets using target speed, the speed you intend for drivers to go, rather than operating speed. The 85th percentile of observed target speeds should fall between 10–30 mph on most urban streets."
